# QGNN-TimeCausality Avancement du projet

## 01

# Avancement dans l'implémentation

#### CauseMe

- J'ai exploré la plateforme CauseMe, qui est principalement un site de benchmarking où les utilisateurs partagent leurs méthodes de découverte causale.
- On y trouve quelques jeux de données, mais ils ne sont pas toujours bien documentés et ils ne sont pas associés à un domaine spécifique (données très générales, vecteurs linéaires, climat, etc.).
- À ce stade du projet, ces jeux de données ne semblent pas particulièrement pertinents pour l'entraînement initial du modèle. Cependant, une fois le modèle développé, ils pourraient être utiles pour des tests comparatifs ou pour évaluer la généricité des performances.

### **PhysioNet**

- J'ai exploré la plateforme PhysioNet, qui propose un large éventail de jeux de données médicaux.
- Ces jeux de données sont bien documentés et couvrent des thématiques cliniques diverses, ce qui les rend prometteurs et potentiellement très utiles pour le projet.
- Toutefois, tous les ensembles ne sont pas directement exploitables dans le cadre d'une tâche de découverte causale. (Pour que le dataset soit pertinent, il est essentiel qu'il contienne des variables avec des relations causales claires ou exploitables, ou qu'il permette d'en inférer.)
- Je vais donc approfondir mes recherches sur PhysioNet afin d'identifier des jeux de données qui respectent ces critères.

#### Open databases

- Abdominal and Direct Fetal ECG Database: Multichannel fetal electrocardiogram recordings obtained from 5 different women in labor, between 38 and 41 weeks of gestation.
- A Comprehensive Dataset of Pattern Electroretinograms for Ocular Electrophysiology Research: The PERG-IOBA
  Dataset: 336 CSV records with 1354 PERG responses (microvolts) from 304 subjects at IOBA. Includes age
  (years), gender, diagnoses, and visual acuity in logMar scale.
- AF Termination Challenge Database: ECG recordings created for the Computers in Cardiology Challenge 2004, which focused on predicting spontaneous termination of atrial fibrillation.
- AHA Database Sample Excluded Record: Two ECG signals that were excluded from the 1980 American Heart Association database.
- A large scale 12-lead electrocardiogram database for arrhythmia study: A 12-lead electrocardiogram database for arrhythmia research covering more than 10,000 patients
- A multi-camera and multimodal dataset for posture and gait analysis: Multimodal dataset with 166k samples for vision-based applications with a smart walker used in gait and posture rehabilitation. It is equipped with a pair of Depth cameras with data synchronized with an inertial MoCap system worn by the participant.
- A Multimodal Dataset for Investigating Working Memory in Presence of Music: A multimodal dataset containing fNIRS data along with a wide range of physiological signals like EDA, HR, PPG, etc over the course of n-back experiments in presence of music.
- · A Multi-Modal Satellite Imagery Dataset for Public Health Analysis in Colombia: Multi-Modal Satellite imagery

## Implementation

## 02

## **Questions & Prochaines étapes**

### Questions

- La structure des datasets en general pour ce projet..
- Update concernant l'accès a l'ordinateur quantique de ibm

## **Prochaines etapes**

- Vérifier un peu plus mon raisonnement et mon code
- Rendre l'encodage plus prêt pour les QGNNs ( avec PyTorch ou d'autres outils )

# Merci de votre attention!
